

Aluminum Cleaning & Maintenance

Aluminum does not require special maintenance or cleaning. Some aluminum products will have a vinyl "skin" that protects the material before and during installation. The vinyl should be removed after installation.

Use mild soap and water with a micro-fiber cloth or towel to clean the metal. Then rinse the surface with water to prevent soap stains and spotting. Towel dry the metal to prevent water spots. Other multi-purpose or ammonia cleaners can be used for fingerprints or tough stains. Use of cleaners that contain abrasive components that may scratch or leave a powdery residue are not recommended.
